Automated Data Import and Relationship Mapping using Import Sets & Dot Walking

Ideation Phase
Define the Problem Statements

Date	08 April 2026
Team ID	SWTID-2026-5279
Project Name	Automated Data Import and Relationship Mapping Using import sets &Dot Walking
Maximum Marks	2 Marks

Manual data import from CSV/Excel into the system is time-consuming and may result in errors such as missing values, duplicate records, and incorrect relationship mapping. Due to improper mapping between tables, the system may generate incorrect reports and workflows. Therefore, an automated and accurate method is required to import bulk data and map relationships effectively.

CUSTOMER JTBD CANVAS: AUTOMATED DATA IMPORT & RELATIONSHIP MAPPING

KEY STATEMENT	CHARACTERISTICS	DETAILED DESCRIPTION
I am	Describe customer with 3-4 key characteristics - who are they?	A System Administrator or Data Integration Specialist responsible for maintaining platform data integrity and cross-table synchronization.
I'M TRYING to	List their outcome or "job" they care care about - what are they trying to achieve?	Automate the ingestion of external data while simultaneously mapping that data to related fields in secondary tables without writing complex scripts.
but	Describe what problems or barriers stand in the way - what bothers them most?	Manual data entry is prone to error, and standard imports often require intermediate scripting to reach "referenced" data sitting several layers deep in the database schema.
because	Enter the "root cause" of why the problem or barrier exists - what needs to be solved?	Relational databases are complex; without Dot Walking capabilities in the Transform Map, the system cannot natively "see" beyond the immediate target table to update related records.
which makes me feel	Describe the emotions from the customer's point of view - how does it impact them emotionally?	Frustrated by the repetitive overhead of manual mapping and anxious about potential data silos or "broken" relationships between records.

Example:

TOPIC: AUTOMATED DATA IMPORT AND **RELATIONSHIP** MAPPINNG IMPORT SETS & DOT WALKING

Problem Statement (PS)	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	A CRM Database Admin	Load customer contacts from an external CSV into our core Customer and Account tables	The CSV contains a direct manager name, but I can't easily connect it to existing user records	Without native relationship mapping (dot walking), I have to manually look up and key in the manager sys_id for thous st thousands of records	Frustrated and prone to errors
PS-2	An Operations Manager	Automatically create Incidents from a monitoring tool import, with the correct CI owner and business service assigned	The import only provides CI name; manually updating owner and service is service is a bottleneck	I need a scalable solution using Import Sets and Transform Maps that can map through related CI records, not just direct fields	Overwhelmed by backlogs

Solution Focus: Import Sets, Transform Maps, Dot Walking.
