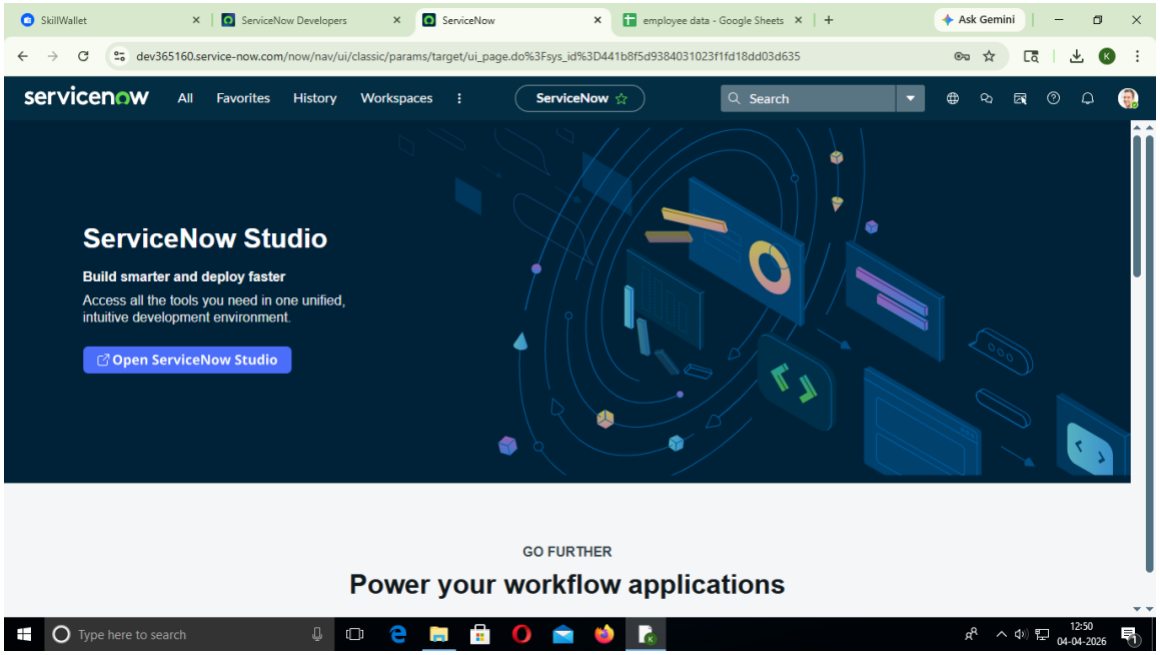
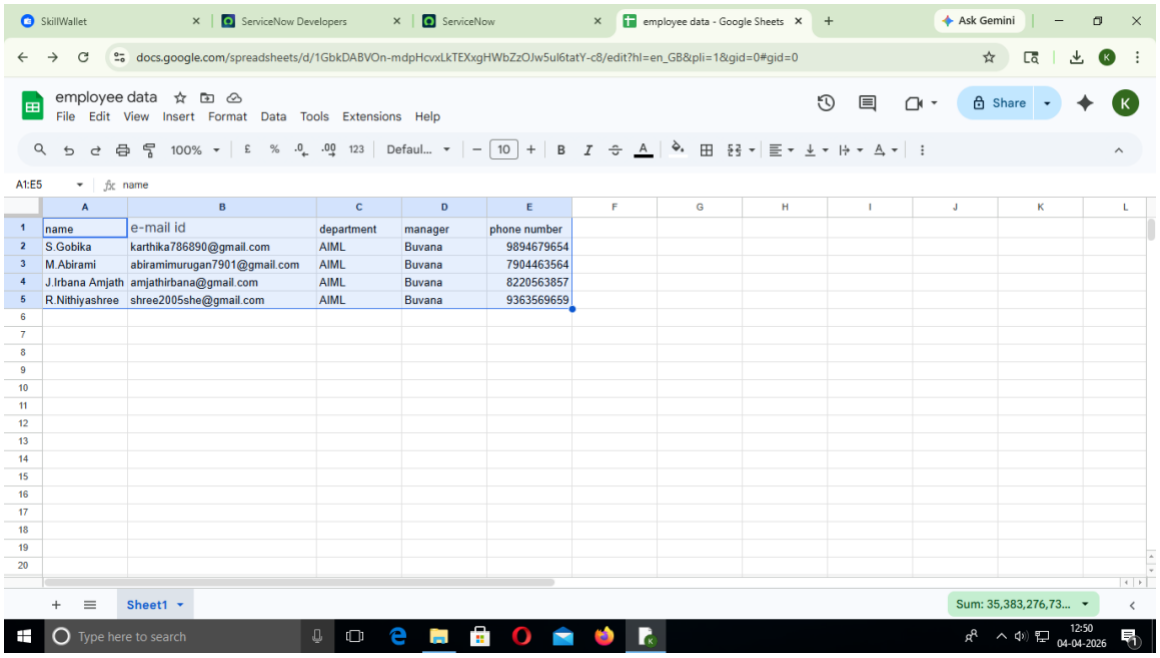
Automating Data Import and Relationship Mapping in ServiceNow Using Import Sets & Dot Walking

1. Introduction



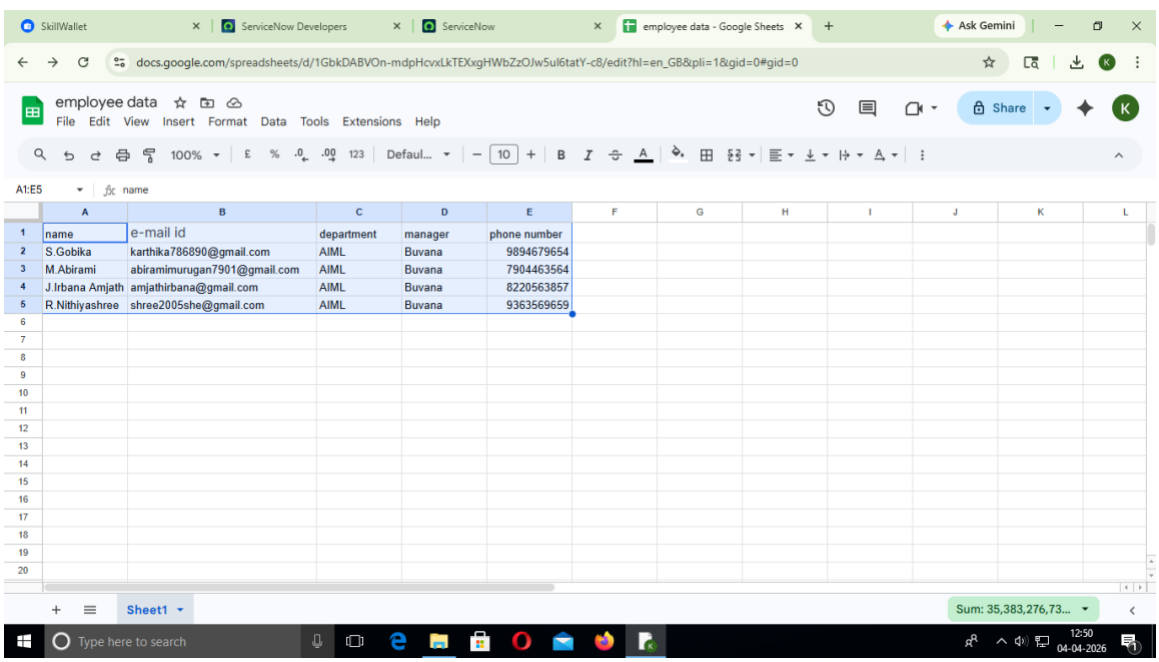
- This project demonstrates how to import employee data into ServiceNow and map relationships using Import Sets and Dot Walking.

2. Data Source (Google Sheets)



Fields: Name, Email, Department, Manager, Phone Number

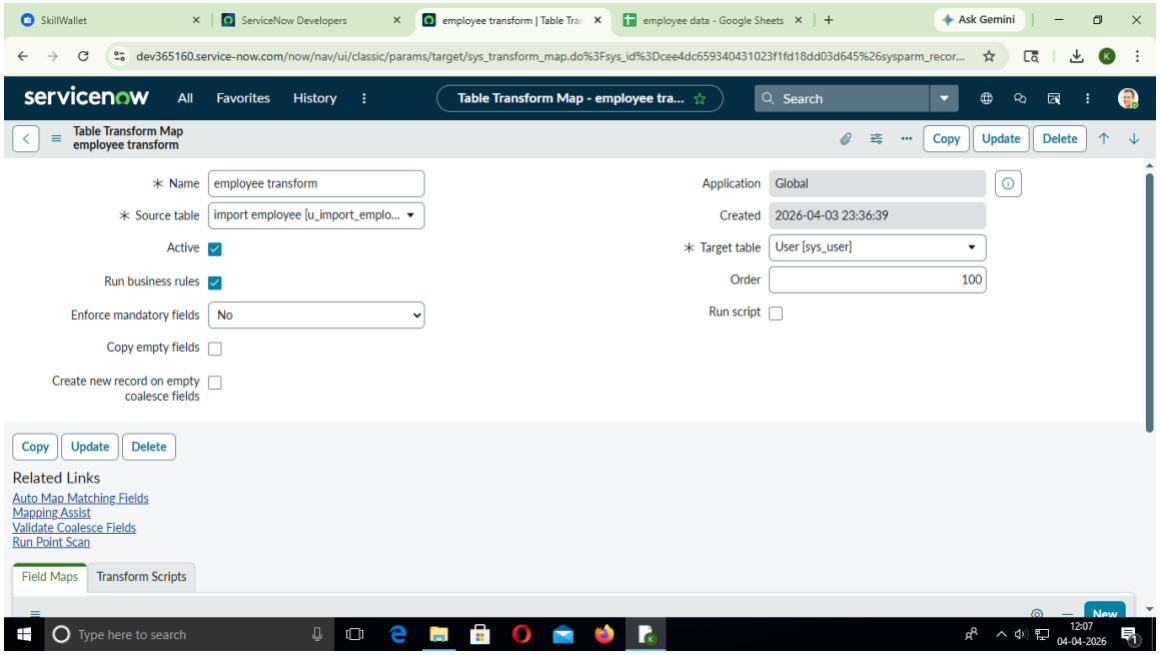
3. Import Set



Definition:

- Import Set is a temporary table used to import external data.

3. Transform Map



Definition:

- Defines mapping from Import Set to target table.

5. Field Mapping

name -> name

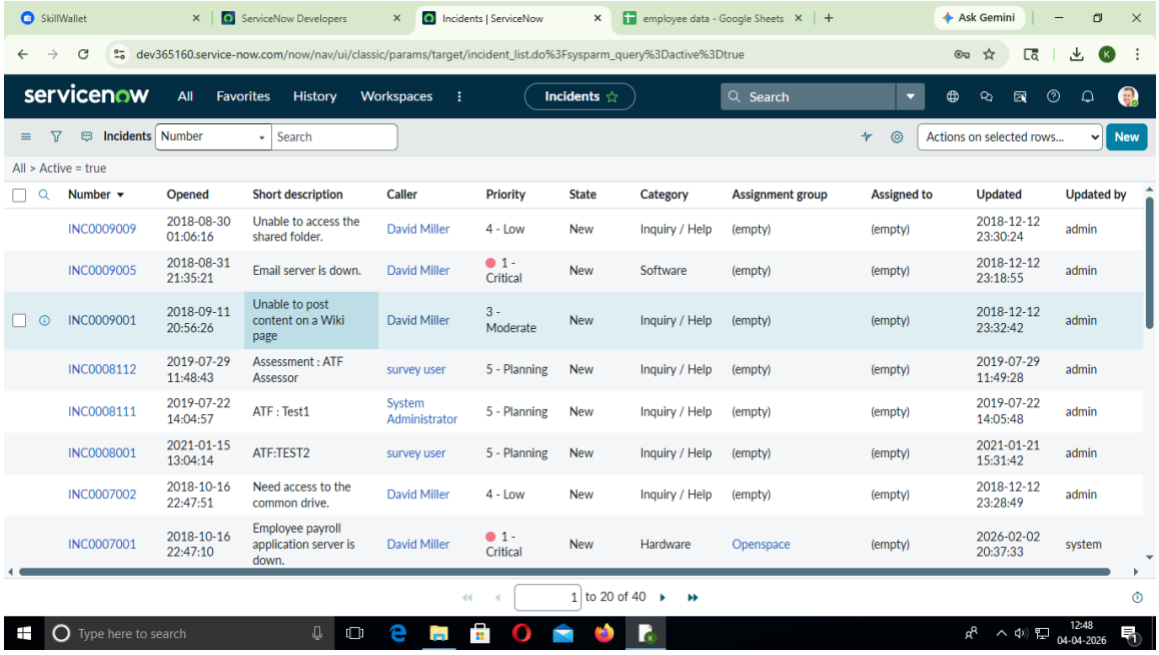
email -> email

department -> department

manager -> manager

phone -> phone

6. Incident Table



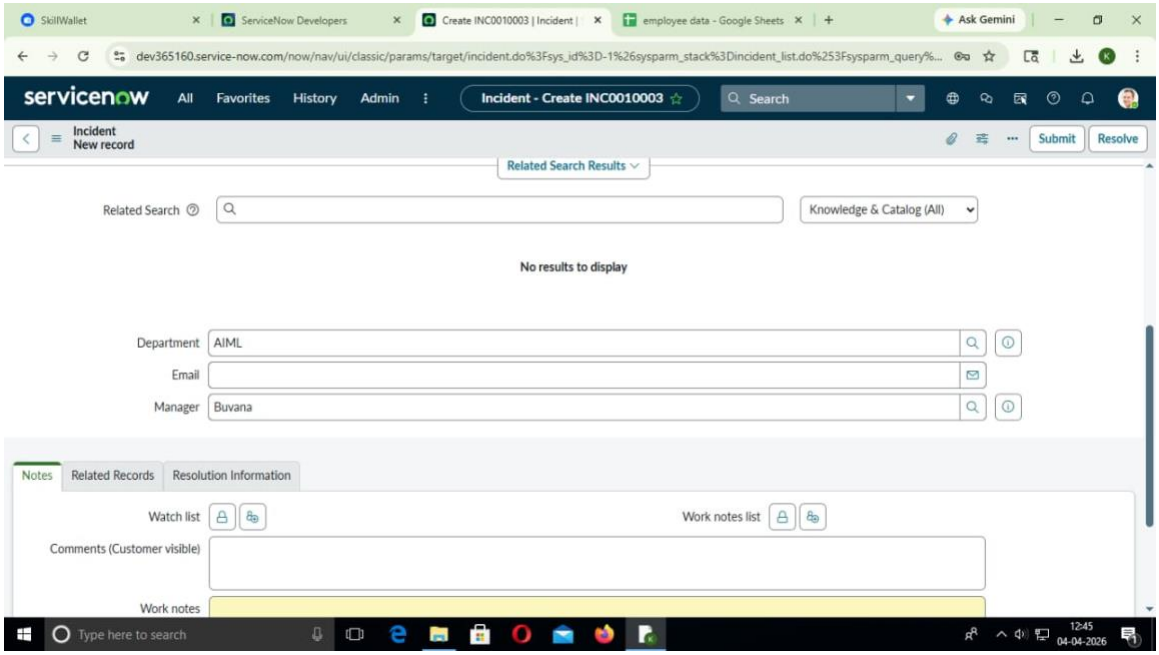
Observation: Department not visible initially

7. Dot Walking

Definition:

Access related fields like assigned_to.department

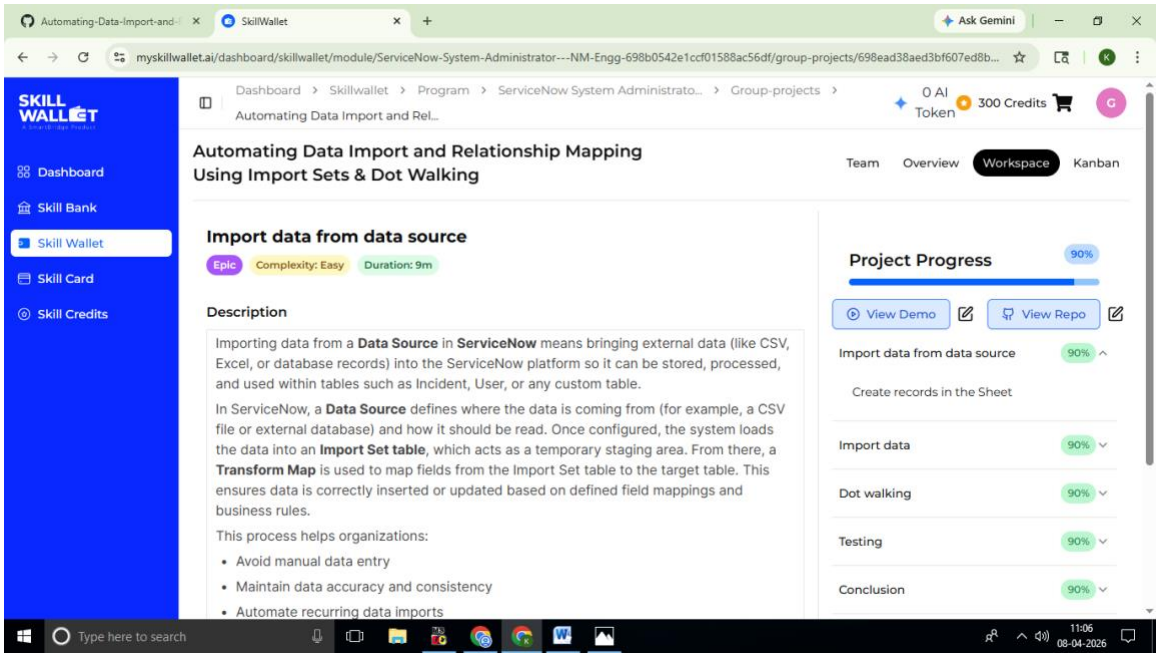
8. Display Department



Steps:

Add assigned_to.department in form layout

9. Final Output



Displays Department, Email, Manager

10. Conclusion

Automating data import and relationship mapping in ServiceNow using Import Sets and Dot Walking streamlines data integration, reduces manual effort, and improves accuracy. It enables efficient handling of large datasets, ensures proper relationships between records, and enhances data consistency, making the overall system more reliable, scalable, and easier to maintain.
